## Policy Brief - #2.17 Case study – Malawi

The impact of tax abuses on Determinants of Health  
and Mortality rates in Malawi

GRADE  
Government Revenue and  
Development Estimation

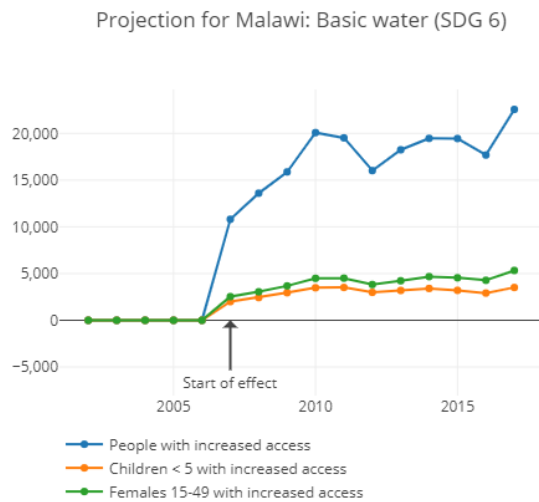

### The consequences of tax abuse

Tax abuse (evasion and avoidance) is increasingly being recognised as a significant barrier to development. Government revenue in low and middle -income-countries relies more heavily on corporate tax than in high-income-countries, and tax abuses by international players can have a much more significant impact on their ability to accrue government revenue and invest in healthcare and education ([Moore, 2015](#)). African countries particularly suffer from the consequences of tax abuse. Many countries have signed unfavourable double tax agreements, which deprive the countries of their rights to accrue revenue from taxes ([Tax Justice Network Africa, 2020](#)). Our [peer-reviewed research on Government Revenue and Development \(GRADE\)](#) has demonstrated that an increase in government revenue in low-income-countries (e.g. through curtailing losses to tax abuse) can have a significant impact on their ability to provide Determinants of Health (e.g. sanitation and drinking water) and reduce under-5 (U5) and maternal survival rates.

### The impact of tax abuses on Malawi

In 2020, the Tax Justice Network released [a report on the State of Tax Justice \(SOTJ\)](#). For the first time, the report revealed an account of how much each country loses annually to tax abuses. From the SOTJ report, we know that Malawi suffers annual tax losses of \$56.6 US Million. We deflated this value into 2010 US Dollars (\$48 US Million), as the GRADE uses 2010 constant US. We then ran this figure through our visualization tool as an increase of annual government revenue to estimate the impact that curtailing these losses would have on Malawi's ability to provide health determinants and increase survival rates. The figures we provided are analysed from 2003-2017, with the assumption that effects on health determinants and survival rates are not accrued for the first 5 years following an increase in revenue. This means that the results are projected over a ten-year period from 2008-2017.

## Impact on drinking water in Malawi

Using our GRADE tool, we can demonstrate that over a ten-year period, on average 60,008 people (of which 10,386 are children and 14,012 are women of reproductive age) would have access to basic drinking water if the revenue lost to tax abuses in Malawi were curtailed.

Figure 1 Projection for Malawi: Basic drinking water

## Impact on sanitation in Malawi

Using our GRADE tool, we can demonstrate that over a ten-year period, on average 49,342 people (8,530 of which are children and 11,519 are women of reproductive age) would have access to basic sanitation if the revenue lost to tax abuses in Malawi were curtailed.

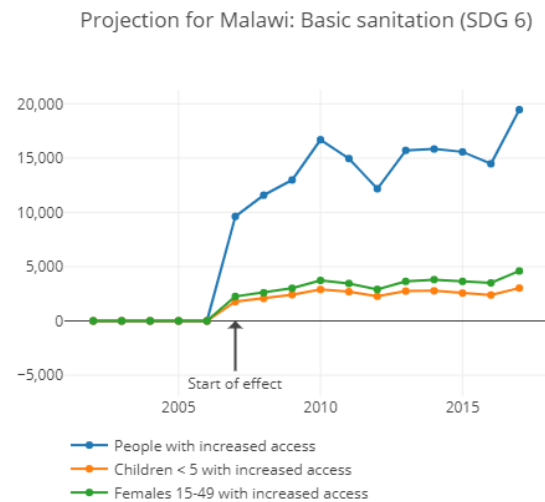

Figure 2 Projection for Malawi: Basic sanitation

## Impact on additional school years in Malawi

Using our GRADE tool, we can demonstrate that over a ten-year period, 4,380 children would attend school for an additional year if the revenue lost to tax abuses in Malawi were curtailed.

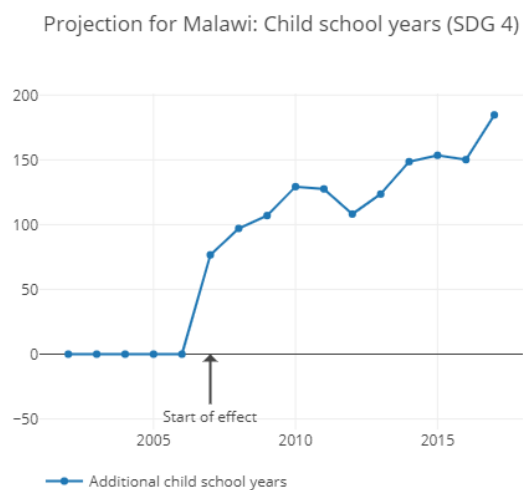

Figure 3 Projection for Malawi: Child school years

## Impact on child survival in Malawi

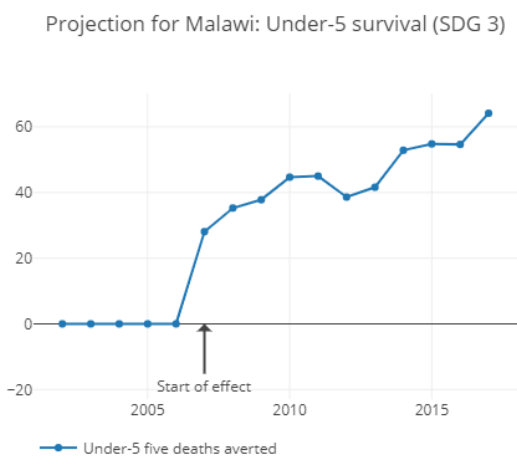

Figure 4 Projection for Malawi: Under-5 survival

Using our GRADE tool, we can demonstrate that over a ten-year period, 1,544 child deaths could be averted if the revenue lost to tax abuses in Malawi were curtailed.

## Impact on maternal survival in Malawi

Using our GRADE tool, we can demonstrate that over a ten-year period, 194 maternal deaths could be averted if the revenue lost to tax abuses in Malawi were curtailed.

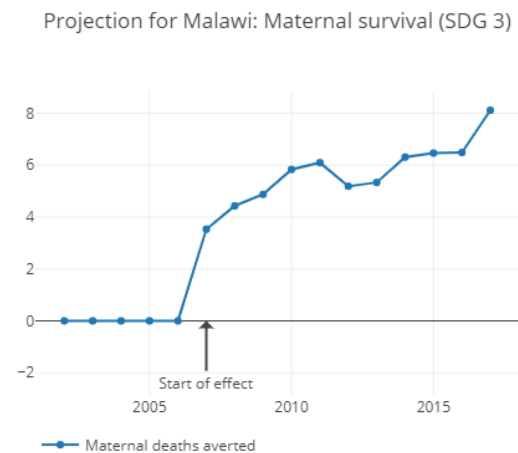

Figure 5 Projection for Malawi: Maternal survival

## Total harm caused to Malawi through tax abuses

To summarise, we estimate that over a ten-year period, 1,544 Under-5 deaths and 194 maternal deaths would be averted, 4,380 children would attend school for an extra year, 6,008 people (of which 10,386 are children and 14,012 are women of reproductive age) would access basic drinking water and 49,342 people (8,530 of which are children and 11,519 are women of reproductive age) would have access to basic sanitation. These figures demonstrate that tax abuses have significant human consequences for people in Malawi and must be carefully reconsidered and validate the huge potential for children if these policies are reviewed.

The impact of curtailing these losses could make a great difference in Malawi's ability to provide healthcare and education and reduce mortality rates. A minor increase in government revenue within low-and middle-income-countries will assist in the promotion of fundamental human rights, a condition of treaties such as the Universal Declaration of Human Rights and the United Nations Convention for the Rights of the Child, it is vital that the impact of tax abuses is recognised.

## Call for Action

These figures demonstrate that tax abuses come with a serious human cost and impact the right to health for many children in Malawi. It is essential that governments worldwide recognise the impact tax abuses have on the Determinants of Health and mortality rates, particularly within low-income-countries. Allowing tax abuses to continue actively undermines fundamental human rights, which stands in direct opposition to the Universal Declaration of Human Rights and the United Nations Convention for the Rights of the Child. We are calling for action from leaders worldwide to take measures to prevent policies which allow tax abuses to continue.
